

WOLF HANDS FREE INTERCOM SYSTEMS

The Wolf Intercom was originally designed in the 1990's for use in the traditional London Taxi to allow hands-free two way conversation between the driver and passengers despite their being a partition between them.

The Wolf Intercom System is extremely versatile and other applications have now been developed for taxi's derived from van's and MPV's, and also a specific version for Ambulances where clear communication between the ambulance driver and the paramedic in the rear compartment is vital.

The Intercom is simple to operate, you just switch it on. There are no volume controls for the user to adjust as these are pre set at the time of installation. This ensures exceptionally clear sound and the absence of feedback.

All our intercoms are built to our customer's specifications and our experts will be pleased to discuss your requirements with you. Options include multi microphones and speakers in the rear compartment to allow the system to work at a higher volume.

In addition both the driver and passengers may have independent on/off switches and a warning led light to tell passengers when their conversation may be overheard by the driver.

The intercom can be designed and built as a tailor-made system for your particular needs and will include all necessary components such as wiring, speakers, microphones, switches and hardware. Alternatively we work with vehicle builders to help you develop your own harness to allow our intercom to be simply installed when required.
